The project as a whole was an interesting experience. Moving through the stages of developing a database, from design to user interface, was very engaging and gave me some good database implementation experience. Some of the database modeling assignments were boring although I know they are essential and unavoidable when creating a proper database system. Nothing was exceedingly easy on this project because I am relatively new to database design and web programming, but I feel that I have improved in both areas over the course of this project. Creating a website was a little repetitive from CSC 307, but the applications of the two projects were so different that they did not overlap too much. Overall, the project was very beneficial and has improved my database and web programming skills.
